Prepare for an exhilarating exploration into the cutting-edge research that is shaping our understanding of the cosmos.

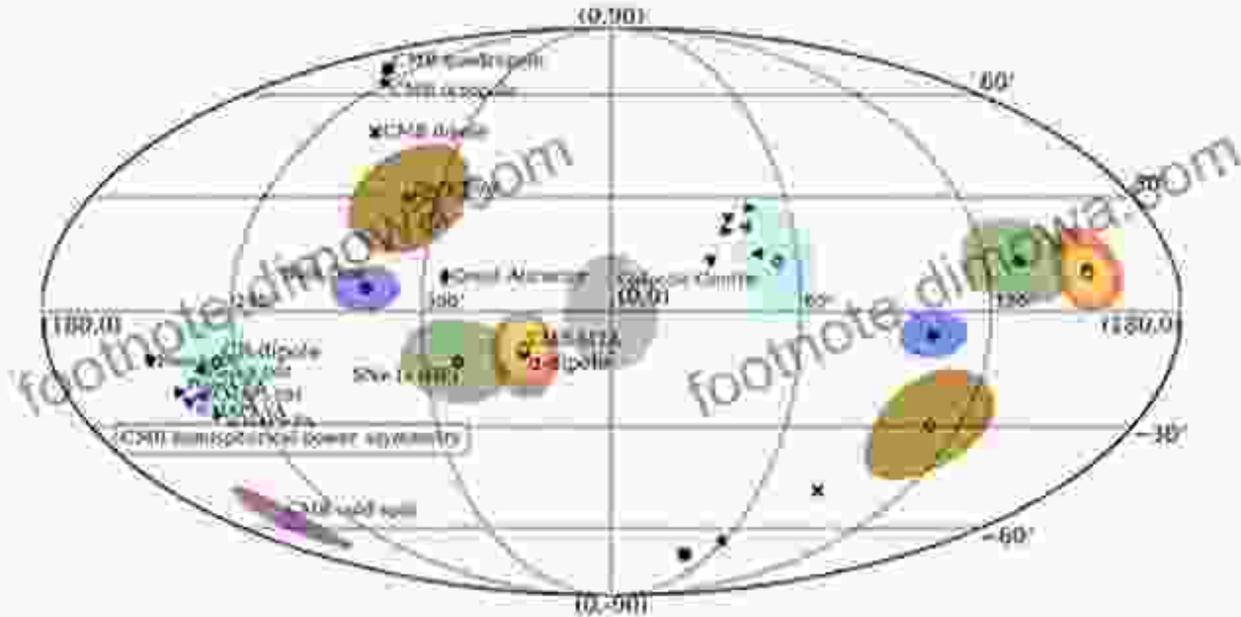

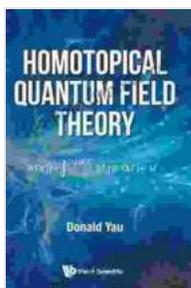

FIG. 25. Putative directions of anisotropy in the Universe in the galactic (l, b) coordinates with the galactic centre in the middle (grey ellipse). Directions from the literature are shown with different markers (if either no uncertainties were reported or the uncertainties are far too small to be seen) or ellipses (with the sticks in the middle being the mean coordinates and the size of the ellipses corresponding to their 1 σ uncertainties) with text labels. The corresponding anti-directions ($l' = l + 180^\circ$, $b' = -b$) are shown with the same ellipse/markers with the text label. The following directions are shown: CMB kinematic dipole (orange), CMB isotropic (blue), CMB quadrupole (green), CMB hexadecapole (purple), CMB low-l multipole power asymmetry dipole (yellow) based on WMAP (blue triangles) and Planck (black triangles) data and measured with the dipole modulation, full-sky (pointing), power asymmetry (right-pointing), and quadrupole asymmetry (down-pointing) methods, the Great Attractor (black triangle with an anti-direction shown), dark flow direction (brown ellipse), bulk flow direction (blue ellipse), ^{56}Fe dipole (green ellipse), line-of-sight constant dipole (red ellipse), CMB maximum temperature asymmetry (red ellipse), high energy cosmic ray dipole (cyan ellipse) and Cold Spot (purple ellipse with no anti-direction shown).
