Mathematical Physics: Classical Mechanics (Unitext 109) provides a comprehensive and rigorous to classical mechanics. This book is an ideal textbook for undergraduate and graduate students who are majoring in physics, mathematics, and engineering.

The book begins with a discussion of the basic concepts of classical mechanics, such as position, momentum, and force. It then goes on to develop the mathematical tools that are needed to solve classical mechanics problems. These tools include vector calculus, differential equations, and Lagrange's equations.

The book covers a wide range of topics in classical mechanics, including:

- Newton's laws of motion
- Energy and momentum conservation
- Rigid body motion
- Lagrange's and Hamilton's equations
- Special relativity
